

Radio Communication Solutions

# Motorola P25 Digital Radio

Radio Communication Solutions would like to introduce the next generation in mine site radio communications; the XTL2500 mobile & the XTS2500 portable. Motorola are world leaders in P25 technology & have hundreds of systems operational globally.

These radios are capable of operating in analogue mode to cater for existing mine systems & also capable of P25 digital trunking which will be implemented at many mines in coming years. Future proof your communications investment with these radios which have sufficient capacity to accommodate all existing mine systems.

As P25 is an evolving standard RCS recommends the radios are purchased with the basic P25 Conventional & analogue configuration until sites have determined their system configurations, this ensures any future enhancements can be included when these systems become operational.

Due to Motorola's experience in P25 radio they can offer many enhancements such as simultaneous voice & data & over the air programming which are absent from most of their competitors products

Please contact an RCS sales representative if you would like any further information on Motorola P25 products or any other communications requirements
